Packing Replacement

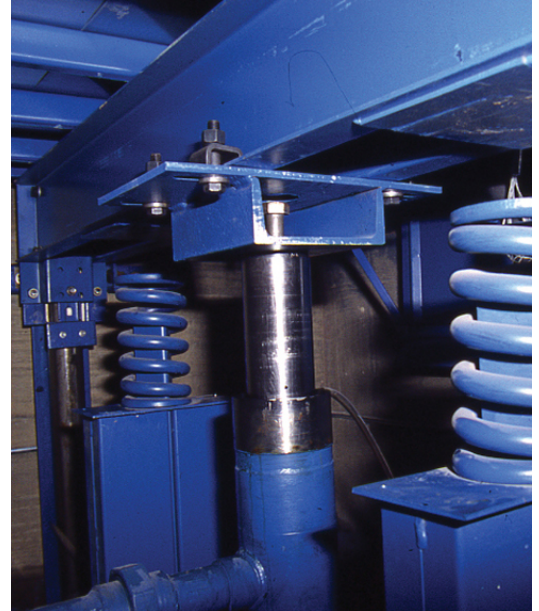

Avoid Oil Leaks In Your Elevator Pit

When excessive hydraulic fluid is present in the pit, the packing may need to be replaced.

Packing is a synthetic rubber reinforced casing, formed in rings, that fits tightly against a piston in the head of the cylinder. This flexible material holds a specific amount of oil allowing free movement of the piston through the packing. With normal wear, the packing may become deficient and loose around the piston. Any scratches or tears in the packing or the piston, or even a small amount of dirt or debris, can create an outlet for oil leaks.

Features and Benefits

- Packing Replacement ensures that your elevator equipment is safe and well maintained, which improves overall passenger safety.
- Readily available in a variety of sizes to fit job requirements.
- Ensures that the jack won't leak oil into the pit.
- Eliminating oil leaks reduces safety issues occurring from hazardous working conditions and environmental damage.
